1 Department of Surgery, Mount Sinai Medical Center, Miami Beach, Florida, USA.
2 Division of Laparoscopic and Bariatric Surgery, Department of Surgery, New York Presbyterian Hospital, Joan & Sanford I. Weill Medical College of Cornell University, New York, NY, USA.

A 54-year-old woman was admitted complaining of fever and upper quadrant tenderness. The patient had undergone a laparoscopic re-sleeve gastrectomy after laparoscopic biliopancreatic diversion with duodenal switch (DS). Her postoperative course had been complicated by an intra-abdominal recurrent abscess documented on computed tomography scan (heterogeneous low-density collection) and upper gastrointestinal series (Figures 1 and 2).

Figure 1. Computed tomography scan

Figure 2. Upper gastrointestinal series

¿What is you diagnosis and which approach would you prefer to treat this patient?
