Abstract

The concentration levels of some heavy metals (Ni, Cu, Mn, Fe, Zn) were detected in tissue muscle from molluscs, crustaceans and fishes of Coatzacoalcos River and Ostion Lagoon, Ver., Mexico. The results show low levels of these metals from the organisms of the two areas studied, with exception of the Ni and Zn in the organisms of the Ostion Lagoon. Finally, the range of accumulation of the analyzed elements showed the following sequence: molluscs > crustaceans > fishes.
