Introduction

Solid-phase synthesis is a revolutionary approach which was originally developed for peptide synthesis but has been extended to a wide variety of organic syntheses. Solid-supported synthesis benefits from the ability to drive reactions to completion by use of excess reagents. Moreover, purification is simplified through simple filtration and washing of the on-bead products at each step. Microwave radiation has previously been employed for several types of solid-phase reaction, and it has shown to be an efficient method to improve yields and speed up library synthesis of discrete molecules. Despite the achievements in this area relatively few techniques have been suggested to fill the lack of alternatives to monitor solid-supported reactions. As a consequence, chemists perform reactions for longer than necessary when attempting to ensure complete conversion to the desire product. Though few methods thus far have been described to assess supported intermediates, FT-IR spectroscopy is emerging as an attractive alternative.

In order to test the efficacy of microwave irradiation in conjunction with FT-IR analysis for solid-phase reactions we selected the thiazole building block 2 as a combinatorial scaffold. Interestingly, anthelmintic and antitumoral activity have been described for 2,4-disubstituted thiazoles or thiazolidines. Mycothiazole, a natural product isolated from the marine sponge Spongia mycofijiensis, typifies this class of molecules. The synthesis of new mycothiazole analogues is desirable in the search for new pharmacologically active compounds. Herein, we describe the microwave-assisted solid-phase conversion of secondary alcohol 3 to its corresponding amine 7 (Scheme 1), potentially useful as a nucleophile in the synthesis of thiazole libraries. The previously reported KBr pellets/FT-IR method was successfully used to monitor each reaction step.

Results and Discussion

Substrate 2 was loaded onto Merrifield resin, using Cs₂CO₃ and KI in DMF under microwave radiation, to give 3 within 5 minutes. This protocol is frequently cited in the literature as requiring 16 hours or longer without the assistance of microwave. The progress of the reaction was evaluated throughout its course by FT-IR (KBr pellets). The appearance of a C=O vibration at 1736 cm⁻¹ was measured, which confirmed its completion within 5 minutes (Figure 1A). Subsequent mesylation of 3 provided the leaving group needed for the next step. This reaction was monitored by following the absorption of the SO₂ symmetric stretch vibration (1174 cm⁻¹). Figure 1B shows that sulfonate formation was completed within 10 minutes. Nucleophilic substitution by azide, also assisted by microwave radiation, resulted in rapid appearance of a 2093 cm⁻¹ band attributed to a -N=N+=N- out-of-plane motion.

**Scheme 1.** Solid and solution phase synthesis of 7. Conditions: i) Merrifield Resin, Cs₂CO₃, KI, DMF, MW (90w), 12 min; ii) MsCl, Et₃N, CH₂Cl₂, 30 min; iii) Na₂S₂O₄, NH₄Cl, MW (270w), DMF, 30 min; iv) thiophenol, SnCl₂, Et₃N, CH₂Cl₂, 1.5 h; v) 0.2 mol L⁻¹ NaOMe/MeOH, CH₂Cl₂, 30 min; vi) KOH, MeOH/water, rt., 6 h.

**Figure 1.** Solid-phase reactions monitored by FT-IR illustrating the bond of interest. The graphs were obtained by comparing the band’s height to a reference generating the ratio B/A.**

- **Graph A:** MR → C=O axial vibration (1736 cm⁻¹) and B = C-C axial deformation from aromatic ring in the polystyrene resin (1450 cm⁻¹).
- **Graph B:** A = C=O (1736.5 cm⁻¹) and B = S=O symmetric vibration (1174 cm⁻¹).
- **Graph C:** A = N=N+=N⁻ vibration (2093 cm⁻¹) and B = C-C (1450 cm⁻¹).
- **Graph D:** A = N=N+=N⁻ out-of-plane motion (2093 cm⁻¹) and B = C-C (1450 cm⁻¹).
Synthesis of 2,4-Disubstituted Thiazole Combinatorial Unit on Solid-Phase

Though many methods of azide reduction are described in the literature, not all are appropriate for solid-phase synthesis due to poor compatibility of some reagents with the polymeric matrix. For our desired on-bead reduction, however, we successful utilised thiophenol as an electron-transfer reagent in the presence of SnCl₂. The gradually disappearance of absorption at 2093 cm⁻¹ confirmed complete reduction in 1.5 hours (Figure 1D). Cleavage of the product from the solid-supported was carried out with sodium methoxide. Complete disappearance of the resin-bound ester carbonyl band (1736 cm⁻¹) indicated that the substrate was totally released after 30 minutes (graph not shown) in a satisfactory yield of 26% over five steps. TLC analysis of the filtrate showed the presence of the desired amine and also some faster-running impurities, which were purified and identified by H NMR as vinyl products (8 and 9). In order to understand the origin of these alkene products the analogous synthetic pathway was performed in solution-phase.

Solution-phase synthesis started by selective deprotection of 1 using transesterification conditions, which were also applied to release the substrate at the last step of the solid-phase sequence. The mesylation was successfully installed with reasonable yield (48%), but phase nucleophilic substitution the azide group was clearly indicated that during this step a simultaneous importance of microwave for this reaction. Results however, only under microwave radiation; thus emphasizing the successful installation of the azide group in solution-phase. The undesirable competing elimination occurred to yield the diastereomeric product with slightly less reagent in comparison to the step of the solid-phase sequence. The mesylation was performed by loop injection using a GC-MS Shimadzu system. Column Phenomenex LURIA 3 split was used to detect the presence of the desired product. The HPLC was run using a mobile phase water (A) (formic acid 0.1%) and acetonitrile (B) (formic acid 0.1%). Gradient initial composition 5% B, to 95% B over 4 minutes. Elution for 3 minutes at 95% B, returned to 5% B in 0.2 minutes. Total run time: 9 min, flow rate: 1.5 mL min⁻¹, 200 µL split via a zero dead volume tee piece which pass into the mass spectrometer. Column Phenomenex LURIA C18(12) 100 A 50 x 4.60 mm. Alternatively mass analysis were performed by loop injection using a GC-MS Shimadzu 1000-EX. Microwave-assisted reactions were carried out in a Sharp (Carousel I) domestic microwave oven.

All anhydrous solvents were dried according to literature methods. All reactions requiring anhydrous conditions were conducted using glassware dried with a heating-gun under positive pressure of dry nitrogen. Merrifield resin was purchased from Aldrich (loading 2.5 mmol g⁻¹, 1% cross-linked) and reaction stoichiometries were calculated assuming 2.5 mmol g⁻¹. A diastereomeric mixture of thiazoles 1 was used as synthetic precursor.

Conclusions

Solid-phase reactions involving the conversion of a hydroxyl group in the thiazole template were shown to be a quick and easy method to obtain target amine within a total reaction time of 2 hours. This is an important aspect for the purposes of building library compounds. Microwave radiation drastically reduced the reaction times of the coupling and azide substitution steps. The undesirable elimination did not represent a serious disadvantage for the synthesis proposed as the target product 7 was obtained successfully in yield of 15% in acceptable yield using immobilized intermediates. The FT-IR (KBr pellets) spectroscopy technique was used successfully to monitor the entire solid-phase synthesis and showed that many reactions can be carried out in shorter times than those usually specified.

Experimental

General

All FT-IR spectra were recorded on a Shimadzu 8001 Spectrophotometer following a previously published method. One- and two-dimensional H and ¹³C NMR were measured either at 300 and 75 MHz respectively, using Bruker Avance NMR spectrometer. Samples were dissolved in CDCl₃ and chemical shifts are reported as δ values (ppm) relative to TMS. The mass spectra were collected using Waters Micromass ZQ coupled to a Waters 2695 HPLC and a Waters 2996 PDA. Waters Micromass ZQ parameters: Capillary (kV) 3.38; Cone (V) 35; Extractor (V) 3.0; Source temperature (°C) 100; Desolvation Temperature (°C) 200; Cone flow rate (L/h) 50; Desolvation flow rate (L/h) 20. The HPLC was run using a mobile phase water (A) (formic acid 0.1%) and acetonitrile (B) (formic acid 0.1%). Gradient initial composition 5% B, to 95% B over 4 minutes. Elution for 3 minutes at 95% B, returned to 5% B in 0.2 minutes. Total run time: 9 min, flow rate: 1.5 mL min⁻¹, 200 µL split via a zero dead volume tee piece which pass into the mass spectrometer. Column Phenomenex LURIA C18(12) 100 A 50 x 4.60 mm. Alternatively mass analysis were performed by loop injection using a GC-MS Shimadzu 1000-EX. Microwave-assisted reactions were carried out in a Sharp (Carousel I) domestic microwave oven.

Synthetic procedures (Scheme I)

2-(1-benzyl-2-hydroxy-propyl)-thiazole-4-carboxylic acid (2). To a solution of 1 (200 mg, 0.60 mmol, 1.0 Equiv.) in methanol (1 mL) was added KOH (135 mg, 2.4 mmol, 4.0 Equiv.) dissolved in water (2 mL). The mixture was stirred at room temperature for 6 h. Work-up involved acidification to pH 3 (50% HCl) and subsequent extraction with EtOAc (3 x 5 mL). The organic layers were combined, dried over Na₂SO₄ and concentrated under vacuum to afford 2 as an off-white solid. (163 mg, 98%) (2) IR (KBr pellet) νmax/cm⁻¹: 3410, 3117, 2928, 1717 (C=O), 1495, 1437, 1379, 1217, 1115, 1069, 1032, 964, 922, 899, 752, 700. ¹H NMR (CDCl₃, 400 MHz) δ 1.20 (d, 3 H, J 6.4
Hz, CH₃), 3.12-3.22 (m, 2 H, CH₂), 3.46 - 3.50 (m, 1 H, CH), 4.16 - 4.20 (m, 1 H, CHOH), 7.10-7.28 (m, 5 H, Ar), 8.18 (s, 1 H, CH₅). ¹³C NMR (CDCl₃, 100 MHz): δ 172.4 (C2), 164.3 (C=O), 146.1 (C4), 138.9 (Ar), 129.4 (Ar), 129.0 (Ar), 128.9 (C5), 127.0 (Ar), 68.7 (COH), 52.9 (CH), 39.9 (CH₂), 20.6 (CH₃). MS (EI, 70 eV) m/z (rel. intensity) 91.2 ([Bn]+, 100%), 186.3 ([M - Bn]+, 37.66%), 277.3 ([M + H]+, 1.74%).

2-(1-Benzyl-2-hydroxy-propyl)-thiazole-4-carboxylic acid methyl ester (3'). To a solution of 1 (300 mg, 0.90 mmol, 1.0 Equiv.) in dry CH₂Cl₂ (4 mL) was added a freshly prepared 0.2 mol L⁻¹ sodium methoxide solution in methanol (2 mL, 0.40 mmol, 0.45 Equiv.). The reaction was heated at reflux for 30 minutes. The excess solvent was then evaporated under vacuum and the resulting oil was subjected to flash chromatography (Cyclohexane/EtOAc 7:3), affording 3' as colorless oil. (217 mg, 83 %)

IR (film) νₘₒₒₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑₑехал 2-(2-Azido-1-benzyl-propyl)-thiazole-4-carboxylic acid methyl ester (4'). To a solution of 3' (100 mg, 0.34 mmol, 1.0 Equiv.) in dry CH₂Cl₂ (1.5 mL) was added dry triethylamine (0.07 mL, 0.52 mmol, 1.5 Equiv.) and mesyl chloride (0.03 mL, 0.38 mmol, 1.1 Equiv.). After 1.5 minutes intervals, and then the resin was washed with DMF (5 mL), THF (10 mL) and diethyl ether (10 mL). The reaction was sampled during the intervals by stopping the microwave radiation and the FT-IR spectra were recorded as previously reported. The reaction was carried out under microwave radiation (90w) for 12 minutes (45 seconds intervals).

Afterwards the resin was washed with DMF (5 mL), methanol (3 mL), water (10 mL), THF (5 mL) and diethyl ether (3 mL). The reaction was sampled during the intervals by stopping the microwave radiation and the FT-IR spectra were recorded as previously reported. Each sample was washed was described above.

Solid-phase coupling reaction (3). To a suspension of Merrifield Resin (1.25 g, 3.12 mmol, 1.0 Equiv.), in dry DMF (9 mL) was added 2-(2-Azido-1-benzyl-propyl)-thiazole-4-carboxylic acid methyl ester (4') and mesyl chloride (0.03 mL, 0.38 mmol, 1.1 Equiv.). The reaction was carried out under microwave radiation (270 w) for 30 minutes (1.5 minutes intervals). To the mixture was added water (4 mL) and it was extracted with EtOAc (4 x 3 mL), the organic phases were combined, dried over Na₂SO₄, and concentrated in vacuo. Flash chromatography (Cyclohexane/EtOAc 10:0 to 7.5:2.5) gave 5' as yellowish oil. (38 mg, 48%). A mixture of higher Rₚ by-products was also isolated (15 mg, 12%). The ¹H NMR spectrum of the mixture showed to separated olefin peaks (6.0 and 6.8 ppm) corresponding to the E and Z isomers (8 and 9).

Solid-phase mesylation (4). To a suspension of 5' (9 mL) was added NaN₃ (42 mg, 0.90 mmol, 2.6 Equiv.) and NH₄Cl (17 mg, 0.45 mmol, 1.3 Equiv.). The reaction was carried out under microwave radiation (270 w) for 30 minutes (1.5 minutes intervals). To the mixture was added water (4 mL) and it was extracted with EtOAc (4 x 3 mL), the organic phases were combined, dried over Na₂SO₄, and concentrated in vacuo. Flash chromatography (Cyclohexane/EtOAc 10:0 to 7.5:2.5) gave 5' as yellowish oil. (38 mg, 48%). A mixture of higher Rₚ by-products was also isolated (15 mg, 12%). The ¹H NMR spectrum of the mixture showed to separated olefin peaks (6.0 and 6.8 ppm) corresponding to the E and Z isomers (8 and 9).

Solid-phase azide formation (6). To a suspension of 5' (9 mL) was added NaN₃ (42 mg, 0.90 mmol, 2.6 Equiv.) and NH₄Cl (17 mg, 0.45 mmol, 1.3 Equiv.). The reaction was carried out under microwave radiation (270 w) for 30 minutes (1.5 minutes intervals). To the mixture was added water (4 mL) and it was extracted with EtOAc (4 x 3 mL), the organic phases were combined, dried over Na₂SO₄, and concentrated in vacuo. Flash chromatography (Cyclohexane/EtOAc 10:0 to 7.5:2.5) gave 5' as yellowish oil. (38 mg, 48%). A mixture of higher Rₚ by-products was also isolated (15 mg, 12%). The ¹H NMR spectrum of the mixture showed to separated olefin peaks (6.0 and 6.8 ppm) corresponding to the E and Z isomers (8 and 9).
(155 mg, 0.38 mmol, 1.0 Equiv.) in THF (3 mL) was added triethylamine (0.27 mL, 1.90 mmol, 5.0 Equiv.), thiophenol (0.16 mL, 1.55 mmol, 4.0 Equiv.) and SnCl₂·2H₂O (112 mg, 0.43 mmol, 1.1 Equiv.). The reaction was stirred at room temperature for 1.5 h. Afterwards the resin was washed with methanol (5 mL), THF (3 mL), THF/water (5 mL), THF (3 mL) and diethyl ether (3 mL).

Cleavage (7). To a suspension of 6 (177 mg, 0.44 mmol, 1.0 Equiv.) in dry CH₂Cl₂ (4 mL) was added freshly prepared 0.2 mol L⁻¹ sodium methoxide solution in methanol (2 mL, 0.4 mmol, 0.25 Equiv.). The reaction was stirred for 30 minutes, and the resin was drained with methanol (2 mL, 0.4 mmol, 0.25 Equiv.). The reaction was subjected to flash chromatography (cyclohexane/AcEt 10:1) to afford the diastereoisomeric mixture subjected to flash chromatography (cyclohexane/AcEt 10:1) to afford the diastereoisomeric mixture 7 as yellowish oil. (32.7 mg, 26% overall yield) IR (film) νmax/cm⁻¹: 3400 (br, OH), 3025, 2954, 2920, 1736 (C=O), 1601, 1510, 1493, 1451, 1380 (C-N), 1225, 1113, 1095, 905, 816, 740, 692. H NMR (CDCl₃, 300 MHz) δ 7.07-7.27 (m, 5 H, Ar), 7.99 (s, 1 H, CH5). ¹³C NMR (CDCl₃, 75 MHz): δ 171.4 (C2), 161.8 (C=O), 146.4 (C4), 137.9 (Ar), 128.9 (Ar), 128.5 (Ar), 127.2 (C5), 126.6 (Ar), 52.4 (OCH₃), 50.4 (CH), 50.0 (CHNH₂), 37.4 (CH₂), 17.8 (CH₃). MS (ESI⁺) m/z (rel. intensity) 291.1 ([M + H]⁺, 100%).

Acknowledgments

We are grateful for funding from Conselho Nacional de Pesquisa e Desenvolvimento Científico-CNPq and Associação de Universidades del Grupo Montevideo-AUGM. We also wish to thank Prof. Ana Maria Bergold for providing the FT-IR spectrometer (LAPPS, UFRGS), Joyce C. Espindola (IQ, UFRGS) and Horacio Pezaroglo (UDELAR) for NMR analyses and Cedric Graebin (LASOM) for FT-IR analyses.
