Abstract

Spanish adaptation of the Interpersonal Reactivity Index. The objective of the present study was to analyze psychometric properties of the Interpersonal Reactivity Index (IRI) Spanish version. The scale was administered to one sample of parents (N = 692) and to two samples of college students (N = 1997 and N = 515). Results showed that the Spanish version of the IRI has psychometric properties similar to those of the original version and lead to conclude that the IRI Spanish version is an adequate instrument to be used in Spain as a measure of empathy.
