Abstract

Due to the advance on the field of heart transplants, Anesthesiology plays an important role in experimental surgery. We choose pigs because like a human in the physiological variables. That at was important for us to observe the physiological changes in heart rate, Sat. O2, blood pressure and temperature during the pre and transoperatory for heart transplants surgery in pigs. We don’t find in the literature a previous protocol that described this changes.

Keywords

Pigs, Heart rate (HR), Oxygen saturation (SpO2), Blood pressure (BP), Temperature (T°).
