Abstract

We propose an elaboration of the object of study that is based on a transformation from an object-subject, dialectic relation, to a triadic relation with the inclusion of Law as a third component. As a result, we sketch a model that goes beyond the distinction between depth and surface, to discover a structure with fixed relations, independently of the place occupied by each element. If we prioritize the cut function, the architecture of the subject matter is found both in the inside and the outside of the social structure, allowing us to make a first diagnostic classification based on a discrete series, and not on a continuum.
