Abstract
The teaching of social and moral contents involves specific characteristics that stem from the idea shared by authors like Piaget and Kohlberg about that it is the interaction with peers one of the main factor that enables the change of the intellectual structures. In this context, the development and increase in the new media (Internet) is important not only due to the rise in the available information but also because it entails a change in the concept of communication. The information nets are characterized being two-way and opened to the participation, demanding of users a good capacity to receive information as well as to generate it. That is why its incorporation into the education is so necessary both as conceptual content and as a way or tool to reach other knowledge. In order to begin this way we gather together a wide number of electronics addresses or Web where students as well teachers will find information on the peace, wars, injustices, civil disobedience, democracy and related topics.

Keywords
Informational nets, internet, social and moral contents.
