Abstract

This is an article that shows the progress of a scientific research based on entrepreneurial education as the bases for company creation of the well known EBU, University Professional Managers (Calixto et al 2004). Similarly, this papers presents the proposal of an economic development model based on managerial education as the principal agent of DE quality entrepreneurial network. It aims at giving a great impulse to scientific research based on company creation, under the lights of North’s institutional theory, specifically in underdeveloped and developing economies, in which small advances and few studies have been made (Bruton, Ahlstrom, Obloj 2008) The author of this article also presents some scientific empirical considerations on the quality entrepreneurial network and managerial education based on the studies of Santos and Lifán (2005), besides making a bibliographic revision of ET & P, Entrepreneurship Theory and Practical Journal.
