Abstract

In order to evaluate wheezing during the first year of life, a pilot study is conducted, using methodology of the International Study of Wheezing in Infants (EISL Estudio Internacional de Sibilancias en Lactantes). A validated questionnaire has been applied to infants between 12 and 15 months. The Hospital San Ignacio (Bogotá, Colombia), conducted this application during the period of January 2006 to December 2007. A total of 283 were collected. As a pilot study, the discussion and conclusion is limited, but important in a contributory form. This pilot study clarifies different respiratory aspects. And will give further information about its prevalence.

Keywords

Bronchiolitis, wheezing in infants 12-15 months, pilot study.
