The recent development of A, B, and R cold-tolerant (CT) sorghum (Sorghum bicolor L. Moench) lines, adapted to regions with altitudes of 2200 m, makes convenient their combination with cold-susceptible (CS) lines adapted to tropical and subtropical environments of Mexico, and the evaluation of resulting hybrids in sorghum producing areas. In 1994, 47 hybrids from groups CTxCT, CTxCS, CSxCT, and TFxTF, 14 parental lines, and three control genotypes were evaluated in three environments at Río Bravo, Tamaulipas, and two environments at Celaya, Guanajuato.

Abstract

The recent development of A, B, and R cold-tolerant (CT) sorghum (Sorghum bicolor L. Moench) lines, adapted to regions with altitudes of 2200 m, makes convenient their combination with cold-susceptible (CS) lines adapted to tropical and subtropical environments of Mexico, and the evaluation of resulting hybrids in sorghum producing areas. In 1994, 47 hybrids from groups CTxCT, CTxCS, CSxCT, and TFxTF, 14 parental lines, and three control genotypes were evaluated in three environments at Río Bravo, Tamaulipas, and two environments at Celaya, Guanajuato.

Keywords

Sorghum bicolor, heterosis, hybrids, grain yield.
