The influence of physicians to discourage smoking and to control the addiction on smoker patients has been well demonstrated; nevertheless, this attitude depends mostly on the personal relationship of physician towards tobacco. The aim of this study was to compare the prevalence of smoking habits in physicians reported by the TAMARA trial (Tabaquismo en médicos de la República Argentina) versus the prevalence reported in the 2005 National Survey of Risk Factors (ENFR, Encuesta Nacional de Factores de Riesgo 2005)...
