Abstract

The lithic technology of the Agroceramic Period is a subject has not been minutely studied. Recently, there has been some efforts to improve our knowledge about this subject. This study attempts to describe the functional activities linked to the lithic production in the site of Escobarinos 1. The analysis is focussed on three lithic raw materials: obsidiana, andesita and toba cinerítica.

Keywords

Lithic technology, agroceramic, obsidiana, andesita and toba cinerítica.
