Abstract

Infections in the maxillofacial territory are frequent cases of polymicrobial origin, with very variable clinical manifestations and are associated with multiple entering pathways of microorganisms in the territory. A large percentage of these infections originate in the oral cavity, mainly in bacterial lesions that undergo experienced by the teeth. The complex anatomy of the head and neck allows many of these infections to spread through deep spaces, leading to compromising adjacent organs or anatomical regions, which can lead to high-risk clinical conditions. The clinical cases presented in this article correspond to patients treated at the San Juan de Dios hospital because of infectious processes of the maxillofacial territory, by multidisciplinary teams.

Keywords

Maxillofacial Infections, Pott's puffy Tumor, Cervical necrotizing fasciitis.
