Abstract

The purpose of the present article is to generate a better understanding of the many dimensions of the problem of water in the east of the State of Mexico, and the participation of various actors in public and social life. The zone is under intense pressure from urban expansion and economic activity, and this implies greater extra demand for water in the region. If the present tendency continues, water resources will be insufficient and the effects on the degradation of the natural system will have an increasing impact on the ecosystem and environment of the region.

Keywords

Water, urbanism, region; development.
