Further additions to the Lepidoptera of Algarve, Portugal. II (Insecta: Lepidoptera)

M. F. V. Corley

Abstract

99 species of Lepidoptera are added to the total of 1270 recorded for Algarve given in CORLEY *et al.*, (2000). 53 of these are additions to the Portuguese fauna. 17 species are deleted from the Algarve list. The total number of species listed for Algarve now becomes 1352.

KEY WORDS: Insecta, Lepidoptera, distribution, Algarve, Portugal.

Nova adenda aos Lepidoptera do Algarve, Portugal. II. (Insecta: Lepidoptera)

Resumo

Acrescentam-se 99 espécies de Lepidoptera às 1270 registadas para o Algarve por CORLEY *et al.* (2000). 53 das espécies constituem novidades para a fauna portuguesa. 17 espécies são eliminadas da lista de espécies conhecidas no Algarve. O número de espécies recenseadas para o Algarve passa a ser 1352.

Introduction

The most recent work in the series of papers on the Lepidoptera of Algarve (MONTEIRO & PASSOS DE CARVALHO, 1984; PASSOS DE CARVALHO & CORLEY, 1995; CORLEY *et al.*, 2000) included records up to April 1999. Since that time, a number of species new to Algarve and other significant records have accumulated, sufficient to justify the publication of another paper. There are also several species to be deleted which were recorded through misidentification.

This paper has been kept as short as possible. New records for Algarve (including some which are new for Portugal) are included, together with second records for Algarve for species where the new record is not close to the earlier record, or where there has been no record for a long time, and new re-

cords of larval food plants within the province. Most of the records are my own, but there are important contributions from Rolf Bläsius, Aleš and Zdeněk Laštůvka and smaller numbers of records from several other lepidopterists. The format of the work follows that of CORLEY *et al.* (2000) and most of the introductory remarks in that work apply to this paper also.

The total number of species known from Algarve was given as 1270 in CORLEY *et al.*, (2000). 99 species are added here, but 17 are deleted. 53 of the new species for Algarve are also new to Portugal. This gives a new total of 1352 species in the province, which represents about 58% of the Lepidoptera species reliably recorded from Portugal (based on an unpublished list compiled by the author).

Corrigenda

17 species must be removed from the Algarve list as they are based on misidentifications. *Elachista pollinariella* Zeller, 1839 and *Lobesia cinerariae* Nolcken, 1882 are recorded from elsewhere in Portugal. The remaining 15 species have only been recorded from Algarve, so must be removed from the Portuguese list: *Scrobipalpa remota* Povolný, 1972; *Acompsia cinerella* (Clerck, 1759); *Oegoconia deauratella* (Herrich-Schäffer, 1854); *Notocelia roborana* ([Denis & Schiffermüller], 1775); *Pelochrista infidana* (Hübner, 1824); *Merulempista cingilella* (Zeller, 1846); *Pempeliella boeticella* (Ragonot, 1887); *Pterothrixidia rufella* (Duponchel, 1836); *Homoeosoma nebulella* ([Denis & Schiffermüller], 1775); *Pyrausta castalis* (Treitschke, 1829); *Amaurophanes stigmatalis* (Herrich-Schäffer, 1848); *Crocallis auberti* Oberthür, 1883; *Idaea predotaria* (Hartig, 1941); *Eupithecia limbata* Staudinger, 1879; *Eupithecia subumbrata* ([Denis & Schiffermüller], 1775).

List of families and species

For species new for Portugal, wherever possible, one or more references are given to a work which includes figures of at least the male genitalia, but for a few species I am not aware of any published genitalia illustrations; for a few species a reference is given to a good figure of the imago.

NEPTICULIDAE
