Abstract
This article is the result of a research project funded by the CDCHT, University of the Andes, which was divided by its length in two articles, the first one entitled "Indispensable mechanisms for labor integration in the Border Integration Zone area of Táchira - Norte de Santander", published in the Journal Aldea Mundo No. 24. In this second part presents the characteristics of some components of the local development of migration in the labor field, the results of the evaluation of the rate of participation in work related to education level, gender and age (model of Tella) and the proposed establishment and consolidation of a Geographic Information System (GIS).

Keywords
Geographic Information System, labor migration, local development, population, employment.
