Abstract
The Minnesota Multiphasic Personality Inventory 2, MMPI-2 is one of the best validated multiscale measures for irrelevant responding, malingered psychopathology, and defensiveness. The present paper presents in detail different possibilities, strategies and scales provided by the MMPI-2 for the detection of overreporting responding (F, Fb & F(p) scales, F-K index: positive, and FBS & DsR scales), underreporting responding (L & K scales, F-K index: negative, and S & Wsd scales), and random responding (cannot-say, F, Fb, VRIN & TRIN scales).
