Abstract

This research was made to design a statistical-methodological proposal to measure the organizational intelligence, based on the Peter Senge Fifth Discipline. For this, a feasible project with a stage of documentary exploratory research was developed, under a bibliographical design, obtaining as a result the definition of the Organizational Intelligence construct, the operationalization of the Organizational Learning construct, the development of the instrument scale research and statistical techniques appropriate for statistical analysis of data generated by the scale. The document review provided basic elements, theoretical methodological-statistical, in the construction of a measurement scale of the Organizational Intelligence

Keywords

measurement scale, reliability, knowledge management, organizational intelligence, systemic thinking
