Abstract
This document shows the results obtained in a document review completed with 34 articles (19 empirical and 15 theoretical), related to Occupational Health, which were written in Colombia. Most of them were published in Colombian scientific journals since the 90s. The purposes of this article are to show in a general way, the subjects related with Occupational Health that have been investigated in Colombia recently, and also, to stand out the importance that they have on Occupational Health for social sciences and health research and intervention. As a result, it is found a slow development in Occupational Health research, compared to other countries. As a conclusion, it is necessary to promote the research with combined and time extended methodologies, to achieve a bigger understanding of the phenomenon, as well as to strengthen the connection between the academy and the organizations in order to do right investigations that give solutions to specific problematic issues related to Occupational Health.
